Pillars of Cybersecurity: What We're Trying to Accomplish

Confidentiality - Protection of information from disclosure to unauthorized individuals, systems, or entities. Confidentiality is **data** oriented.

Integrity - Protection of information, systems, and services from unauthorized modification or destruction. Integrity is **data** oriented.

Availability - Timely, reliable access to data and information services by authorized users. Availability is **service** oriented.

Non-repudiation - The ability to correlate, with high certainty, a recorded action with its originating individual or entity. Non-repudiation is **entity** oriented.

Authentication - The ability to verify the identity of an individual or entity. Authentication is **entity** oriented.

Cyber Defense Principles: How we're trying to accomplish it

Least Privilege

- Know who has access to systems and data, and minimize the level of access to only what is required

Defense in Depth

- Know what your critical assets are, and protect them with multiple overlapping security controls

Management and Monitoring

- Know how your assets should be performing, and how they are performing currently

Cybersecurity Fundamentals: Good Cyber Hygiene

1. Risk Identification

- Know your assets & identify what's critical
- Know your network & data
- Know your applications & application versions
- Know the common vulnerabilities

2. Vulnerability Reduction

- Secure network endpoints
- Install asset protection/intrusion detection tools
- Apply principle of least privilege and defense in depth
- Apply mitigations to known vulnerabilities

3. Threat Reduction

4. Consequence Mitigation

5. Enable Cybersecurity Outcomes

Where to Go Next

Definition of Open Source Tools

The software is freely available without cost. It is developed and maintained as a cooperative effort. If you have something to contribute, you may submit your code for inclusion.

Introduction to Open Source Tools

- Open Source tools can be cost effective.
- Many individuals and organizations develop software tools for their own use before there is a commercial equivalent.
- Some go on to become commercial products.
- Some are made freely available.
- Tools are often adapted to:
 - changing needs and requirements
 - use evolving technology

Considerations for Selecting Open-Source Tools

Requirements - Identify your need and then choose your tool.

Skillset - Does your staff have the skills to deploy and maintain the tool?

Support - What support is available? Are patches provided?

User Community Size - Better tools typically have larger/more active user communities

Documentation - What documentation is available for deployment/upkeep?

Source Code Assessment - Open-source code can be reviewed for vulnerabilities by anyone.

Licensing - are there any restrictions on using/changing the source code?

Cost - Calculate total ownership cost or ROI; include deployment cost, staffing support cost, data transfer costs, education and training, etc.

Who are the Key Players in this Space?

Government organizations include:

- U.S. Department of Homeland Security (DHS)
- Cybersecurity and Infrastructure Security Agency (CISA)
- U.S. Computer Emergency Readiness Team (U.S.-CERT)

Non-governmental organizations include:

- MITRE
- Open-Audit
- nMap
- AlienVault
- SIEMonster
- Elastic
- OSSEC
- WAZUH
- Snort
- McAfee
- Microsoft
- Sophos

- Software Engineering Institute

CISA

- The Cybersecurity and Infrastructure Security Agency is the U.S.'s risk advisor, working with partners to defend against today's threats and collaborating to build more secure and resilient infrastructure for the future.

U.S.-CERT

- The United States Computer Emergency Readiness Team is an organization within CISA.
- US-CERT is responsible for analyzing and reducing cyber threats and vulnerabilities, disseminating cyber threat warning information, and coordinating incident response activities.

MITRE

- MITRE has worked closely with government to strengthen U.S. cyber defenses for more than four decades.
- MITRE advocates a balanced security posture that combines classic cyber defense approaches with a new emphasis on leveraging cyber threat intelligence to respond and adapt quickly to a cyber attack.

The MITRE logo is displayed in a large, bold, blue sans-serif font. The letters are thick and closely spaced, with a modern, clean design. The 'M' and 'I' are particularly prominent due to their size and the way they connect to the rest of the word.

Working Towards a Holistic Risk Management Approach

- A Risk Management Approach:
 - acknowledges that it is impossible to prevent cyber incidents;
 - asks "*What's the worst that can happen?*" if a cyberattack was successful;
 - assigns financial, human, and technical resources to the assets and data that are the most critical to your overall business mission;
 - calculates how to prioritize the assignment of resources by:
 - examining the vulnerabilities in networks, systems, and the data you process;
 - determining the threat profile of malicious actors and the likelihood those actors will take advantage of the vulnerabilities you have;
 - factoring in the consequences that would happen if the threat actor executed a successful attack.

- Questions?

Thank you!

Cyber threat analysis is the process of assessing the cyber activities and capabilities of unknown intelligence entities or criminals. Threats posed by cyber-attacks include denial of service attacks (DoS), computer viruses, malware, phishing emails, and others.

Threat Assessment

What is Malware?

Short for “malicious software,” includes any software (such as a virus, Trojan, or spyware) that is installed on your computer or mobile device.

The software is then used, usually covertly, to compromise the integrity of your device.

US-CERT AMAC Malware Analysis

- Cyber analysis and warning capabilities are critical to thwarting computer-based threats and attacks.
- DHS established the United States Computer Emergency Readiness Team (US-CERT) to coordinate the nation's efforts to prepare for, prevent, and respond to cyber threats to systems and communications networks.
